Subject: Comments on Yucca latest EIS and Supplement.

Part of Records Package / Supplement / Correction

- C.htm

Dear Secretary of Energy;

1 I have been submitting comments on YMP and its predecessor for decades. All the things that I have said have come true. The
2 YMP is on active faults. The YMP has fractured rock that allows rainfall to get into repository. The isolation is not assured for
3 10,000 years or even a few with or without engineered barriers. The low population density can change in a day. The weather has
shown a pattern of change locally at YMP and worldwide. The historical evidence is that YMP had more rain in the last century
than presently. The use of titanium as a roof over the waste inside the repository only makes the repository more attractive
commercially to tomb robbers.

Wake up and get out of Yucca Mountain which really is not ours to desecrate as it belongs in the protected areas of the an
American Indian Treaty.

Respectfully submitted,

Marvin I. Lewis
